

READY-TO-USE PADS PREFILLING PADS – DRY KITS

***While the filling of pads in the field is safest and most efficient,
it is not always practical in all situations.***

Hobby Use:

When needing just a few pads it is okay to fill them flat in any rectangular totie, having the drain hole for removing excess acid and pouring it back into the container. Then carry the pads in a strong, sturdy honey bucket to your hive.

Warning to All:

Do not transfer a large amount of prefilled pads unless they are in properly designed packaging.

You should not precut and prefill pads indoors. It does not save any time and it is very dangerous! Using formic acid in any closed space will expose you and your help to a serious health risk. Respirators are of outdoor use only.

- If you precut the pads, the plastic wrap surrounding the pad will shrink and slide off the prefilled pads. Carrying prefilled pads in pails is very dangerous. If the vehicle you are carrying the pads in is in a motor vehicle accident, the pads may become a deadly projectile.
- Wet pads are heavy and fragile. They will break, crack, and lose their function if just thrown into buckets, and can become mashed potatoes. They will be crushed by their own weight if more than 5 are on top of each other or if you take them down a bumpy road.
- **Damaged, squashed, torn, and unwrapped pads will not provide the desired treatment. You may lose your queens and bees.**

Prefilling Pads in Dry Kits:

MiteGone has properly designed packaging for 20 prefilled half pads – dry kits. They have been tested for three years. The key is to fill already cut pads inserted in plastic bags snuggled tightly in a strong box, where pads can not move or be crushed by their own weight. 2 Litre of Acid is taped into kits locally by weight and the package is sealed for transportation and final use.

See Page 2 for larger picture and details.

MiteGone Evaporator Pads – Ready to Use Dry Ready-to-Fill or Pre-Filled with 65% Formic Acid

These kits, containing 20 half-pads, are available from MiteGone or they can be produced locally under our licensing and technology.

By pouring in 2 Litres - 2.4 kg of 65% formic acid you have a ready-to-use product for the hobby market. One 20 half-pad kit will treat four hives twice a year. 3 halves in August, 2 in April

All the beekeeper does is install pads in hives according to the instructions.
